Raw text:

Customer: I want to cancel the shoes I ordered yesterday.

Agent: Welcome to Customer Service.

Agent: I am here to help you.

Agent: Give me a moment to look into this.

Training Sample:

Input: CUSTOMER I want to cancel the shoes I ordered yesterday. **AGENT** Welcome to Customer Service. **AGENT** I am here to help you. **PROFILE** cancellable, carrier, membership-status. **Output:** Give me a moment to look into this.

April Fools

It's the perfect day to learn about pranks throughout history, like this one: For April Fools in 1972, the Veterinary Record published an article on the common household species *Brunus edwardii*, warning people about their diseases. *Brunus edwardii* is more commonly known as the "Teddy Bear"

<p>It's great to wear a pretty dress.</p>	<p>Last week, I won a prize for best drummer.</p>
<p>This flower seemed to have lost its luster.</p>	<p>I received one hundred dollars in prize money.</p>
<p>I knew you would like my new outfit.</p>	<p>Do you know the peace sign?</p>
<p>I never you liked rock music.</p>	<p>I asked my mom if I could</p>

In mathematics, an arithmetic-geometric sequence is the result of the term-by-term multiplication of a geometric progression with the corresponding terms of an arithmetic progression.

An arithmetic-geometric sequence is given by the value of a (First term of AP), n (Number of terms), d (Common Difference), b (First term of GP), r (Common ratio of GP). The task is to find the sum of first n terms of the AGP.

Examples:

- Input : First term of AP, $a = 1$, Common difference of AP, $d = 1$, First term of GP, $b = 2$, Common ratio of GP $r = 2$, Number of terms, $n = 3$ Output : 34 Explanation $Sum = 1*2 + 2*2^2 + 3*2^3 = 2 + 8 + 24 = 34$
- The n th term of an arithmetic-geometric sequence is the product of the n -th term of an arithmetic sequence and the n th term of a geometric one.

Arithmetic-geometric sequences arise in various applications, such as the computation of expected values in probability theory. For example, Counting Expected Number of Trials until Success.

n -th term of an AGP is denoted by: $t_n = [a + (n - 1)d] * (b * r^{n-1})$

Method 1: (Brute Force)

The idea is to find each term of the AGP and find the sum. Below is the implementation of this approach:

```

#include <bits/stdc++.h>
using namespace std;
int sumofNterm(int a, int d, int b, int r, int n){
    int sum = 0;
    for (int i = 1; i
  
```
